ONLINE ACTIVITY #1
Personalized Linux, and Git Cheat Sheet

Using any available resources (official Git documentation, online tutorials, or the built-in git --help command), research the following topics and create a personalized 1-page (A4) cheat Sheet:

1. Basic Linux commands (command, sample usage) (at least 10)

Command	Sample Usage	Sample Usage
1. Listing Files (ls)	- to display the files and directories in your current working directory.	- Type ls [options] [directory] Example : ls
2. Creating and Viewing Files (cat)	- command used to display text files. Can also be used for copying, combining, and creating new text files.	-Type cat > filename Example: cat test.txt
3. Print Working Directory (pwd)	- is used to display the full path of the current directory.	- Type pwd
4. Make Directory (mkdir)	- is used to create new directories or folders	- Type mkdir directory_name Example : mkdir OnlineActivities
5. Change Directory (cd)	- is used to change the current working directory.	-Type cd directory name Example: cd OnlineActivities
6. Remove Directory (rmdir)	-is used to delete empty directories	-Type rmdir directory_name Example: rmdir TestFolder
7. Copy (cp)	- is used to copy files or directories	-Type cp OnlineActivities Example: cp file1.txt file2.txt
8. Move (mv)	- is used to move or rename files and directories	-Type mv old_name new_name Example mv old.txt new.txt
9. Remove (rm)	- is used to delete files permanently	-Type rm file_name Example:rm OnlineActivities
10. Touch (touch)	-is used to create empty files and updates files timestamps.	-Type touch file_name Example: touch test.txt

2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags

Command	Usage
git init	-
git status	- Tells you which files have changed and shows the status of files in your working directory and staging area.
git branch	- Creates a new branch where you can make changes without affecting the main branch.
git restore	- Reverts changes in your working files
git add	- marking files as ready to be saved in the next committed repository.
git checkout / git switch	- Switches to another branch.
git commit	- Saves changes to the repository.
git merge	- Combines changes from one branch into another.
git log	- Shows the history of commits
git tag	- Labels a specific commit, often for marking releases.
git diff	- Shows differences between file versions and the last commit so you can see what you modified.
git clone	- Make a copy of a remote repository on your computer.

[GitHub - TrickAndTrack/Git-Commands: These descriptions simplify each command with examples and explanations so you can understand when and why to use each. Let me know if any part needs further clarification! · GitHub](#)

3. the three-tree architecture of Git

Git has three main areas:

1. **Working Directory** – Where you make and modify files after using git init.
2. **Staging Area** – Changes are prepared for the next commit using git add. It acts as a preview of what will be committed.
3. **Repository** – Finalized changes are saved using git commit. This keeps a snapshot of the project's history.

Simple flow:

Working Directory → git add → Staging Area → git commit → Repository

Reference I have not used any AI or AI-assisted technologies to prepare this work see the attached reference. [Understanding Git Architecture and Commands | PDF | Version Control | System Software](#)

You are free to use any design or color scheme, just make sure it is readable.

Submission:

1. Use PDF as the file format for your cheat sheet.
2. Upload it to your GitHub repository
3. Submit the link here
